What is state of charge (SOC) estimation in a battery management system?

Author to whom correspondence should be addressed. State of charge (SOC) estimation is an important part of a battery management system (BMS). As for small portable devices powered by lithium-ion batteries, no current sensor will be configured in BMS, which presents a challenge to traditional current-based SOC estimation algorithms.

How accurate is state-of-charge estimation in battery research?

Accurate estimation of state-of-charge (SOC) of a battery through its life remains challenging in battery research. Although improved precisions continue to be reported at times, almost all are based on regression methods empirically, while the accuracy is often not properly addressed.

How to estimate SOC of lithium-ion batteries?

It can only be estimated based on the relationship between voltage, current, temperature, and the aging of the battery [4]. Therefore, it is crucial to develop reliable SOC estimation algorithms that consider all relevant factors to ensure optimal performance and safety of lithium-ion batteries in various applications.

How reliable is a battery management system (BMS)?

It is necessary to ensure optimal battery performance and longevity in various applications. The reliability of the BMS depends on the precision of the state of charge (SOC) estimation of lithium-ion batteries. SOC indicates the remaining capacity and provides an indication of whether the battery needs to be charged or discharged.

How is capacity loss determined in a lithium-ion battery?

By employing the data from the current curve during the constant voltage step, A, B, C parameters are established. Capacity loss is a direct function of the battery's health status. The following is a summary of several studies found in the literature. In Ref. , a novel method for estimating the SOH of lithium-ion batteries is developed.

Why is soh estimation important in EV battery management systems?
