

Common specifications and models of capacitors

What are the specifications of a capacitor?

The specifications of capacitors are: 1. Capacitance ValueThe value of the capacitor is measured in terms of its capacitance value and is expressed in farads,microfarads,and nanofarads. 2. Voltage Rating

What are the characteristics of a capacitor?

The value of the capacitor is measured in terms of its capacitance value and is expressed in farads, microfarads, and nanofarads. 2. Voltage Rating Voltage rating is the operating voltage of the capacitor and it is measured in volts. 3. Temperature Co-efficient

What are the different types of ceramic capacitors?

Ceramic capacitors are further classified into two categories: Bypass and decoupling applications in power supplies Coupling and filtering in audio circuits Electrolytic capacitors are polarized capacitors that are widely used in electronics and electrical systems.

What are the different types of capacitor values?

According to the number of values per decade, these were called the E3,E6,E12,E24 etc. series. The range of units used to specify capacitor values has expanded to include everything from pico- (pF), nano- (nF) and microfarad (uF) to farad (F). Millifarad and kilofarad are uncommon.

What is a basic capacitor?

Basic capacitors,formerly known as condensers,consist of two parallel plates - one positive and one negative - separated by a dielectric (nonconducting) material. The plates may be square,rectangular,cylindrical,or spherical,resulting in several possible designs and form factors.

What are the two types of capacitors?

Capacitors are divided into two mechanical groups: Fixed-capacitance devices with a constant capacitance and variable capacitors. Variable capacitors are made as trimmers, that are typically adjusted only during circuit calibration, and as a device tunable during operation of the electronic instrument. The most common group is the fixed capacitors.
