Is lithium a good negative electrode material for rechargeable batteries?

Lithium (Li) metal is widely recognized as a highly promising negative electrode material for next-generation high-energy-density rechargeable batteries due to its exceptional specific capacity (3860 mAh g⁻¹), low electrochemical potential (-3.04 V vs. standard hydrogen electrode), and low density (0.534 g cm⁻³).

What is a lithium metal negative electrode?

This results in a lithium metal negative electrode, used in both laboratory or industry scenarios, typically with a thickness of several tens to even hundreds of micrometers, which not only leads to the wastage of this costly metal resource but also significantly compromises the energy density of SSLMBs 10.

What happens if a lithium-deficient battery is a negative electrode?

Therefore, it is reasonable to speculate that in the lithium-deficient scenario, the rapid consumption of active lithium metal in the negative electrode leads to the delithiation of Li₂O to supplement lithium ions and maintain battery cycling 66.

Can lithium be a negative electrode for high-energy-density batteries?

Lithium (Li) metal shows promise as a negative electrode for high-energy-density batteries, but challenges like dendritic Li deposits and low Coulombic efficiency hinder its widespread large-scale adoption.

What factors affect the apparent performance of lithium metal negative electrodes?

The factors affecting the apparent performance of lithium metal negative electrodes are as follows: various characteristics of the freshly deposited layer of lithium metal (morphology, nucleus shape, specific surface area), electrolyte composition, and the results of the interaction between the two (i. e., the formation of SEI).

What are the limitations of a negative electrode?

The limitations in potential for the electroactive material of the negative electrode are less important than in the past thanks to the advent of 5 V electrode materials for the cathode in lithium-cell batteries. However, to maintain cell voltage, a deep study of new electrolyte-solvent combinations is required.

The global lithium ion battery negative electrode material market is expected to grow at a CAGR of 6.5% during the forecast period, to reach USD 1.2 billion by 2028. ... Global Lithium-Ion ...

The pursuit of new and better battery materials has given rise to numerous studies of the possibilities to use two-dimensional negative electrode materials, such as MXenes, in lithium-ion batteries. Nevertheless, both the ...
